HUSKY HACK
Turning Innovation into Trust

STOP THE SCAM BEFORE THE MONEY MOVES

Build a practical intervention that protects people when they are most vulnerable.

YOUR CHALLENGE

How might Sound Credit Union recognize when a member (consumer) is being manipulated, compromised, or deceived and deliver the right intervention before the money is lost?

WHAT YOU WILL DESIGN

Create a member-facing, employee-facing, or combined solution that addresses authorized scams, account takeover, or both. Your idea may focus on prevention, real-time intervention, trusted contacts, employee escalation, or rapid recovery.

- **Authorized scam:** the member is tricked into sending money themselves.
- **Account takeover (ATO):** a criminal gets into the member's account and moves money without permission.
    - The difference matters: regulations generally protect members from unauthorized electronic transfers, but usually not from payments they authorized, even under deception, and wires follow separate rules. Authorized scams therefore leave members most exposed.
        - Recognize a meaningful moment of risk.
        - Intervene before funds become difficult to recover.
        - Protect dignity, autonomy, accessibility, and trust.
        - Work within Sound's realistic capabilities (see Capability Assumptions in the Starter Kit).
        - Show what happens when the solution is right and when it is wrong, including a legitimate member it flags and a scam it misses.

AVAILABLE TO YOUR TEAM

- A student starter kit with fictional scam scenarios, synthetic event data, and a Member Key that includes 20 legitimate members whose activity looks risky.
- Payment amount, timing, channel, rail, status, new-recipient indicators, recent profile changes, password-reset events, held-payment status, balances, history comparisons, and trusted-contact enrollment, as provided in the synthetic data.
- Mobile, online banking, branch, contact-center, notification, human-review, case-escalation, trusted-contact, and recovery concepts.

Turning Innovation into Trust

DO NOT ASSUME ACCESS TO

- Device intelligence, behavioral biometrics, or voice-cloning detection.
- Voice analysis, telecom-carrier data, or third-party fraud-consortium feeds.
- A member's personal calls, texts, email, browser history, social media, or device activity.
- Perfect knowledge that a transaction is fraudulent.

REQUIRED SUBMISSION

- Clickable prototype or more functional demonstration.
- Clear member story and scam or takeover journey.
- The trigger, intervention, data used, and role of people.
- False-positive path and member appeal or override experience.
- Realistic 90-day pilot concept and measurable outcomes, with baseline and target assumptions stated (do not use the synthetic data to claim real fraud rates).
- Privacy, accessibility, and responsible-design considerations.
- A walk-through of your trigger on at least one anchor persona (M1001–M1004) and one legitimate look-alike member from the data.
- Format:
    - Phase 1 (Saturday, October 17): 2 minute elevator pitch with 3 minutes of Q&A.
    - Phase 2 (Sunday, October 18): 5-minute live demo + 3-minute Q&A; up to 10 slides; prototype link due by deadline.

HOW YOUR WORK WILL BE JUDGED

Criteria	Weight
Impact on Member Safety	30%
User Experience & Trust	25%
Feasibility	20%
Innovation	15%
Prototype & Presentation	10%

What judges look for:

Impact on Member Safety (30%)

HUSKY HACK
Turning Innovation into Trust

- Prevents or reduces fraud losses
- Intervenes early enough to make a difference
- Includes recovery or member support considerations

User Experience & Trust (25%)

- Easy for legitimate members to complete transactions
- Clear, accessible, and non-judgmental
- Works for diverse member needs and abilities

Feasibility (20%)

- Realistic to implement
- Uses available data and technology
- Could be piloted by a credit union with reasonable effort

Innovation (15%)

- Creative approach beyond standard warnings or fraud scores
- Introduces a new way to protect members

Prototype & Presentation (10%)

- Clickable or visual demonstration
- Shows how both members and employees interact with the solution
- Clearly communicates the concept

Ties are broken by Member Harm Prevention, then Trust & Accessibility.

GUARDRAILS

Use only synthetic or challenge-provided data. Do not submit only an awareness campaign or fraud score. Trusted-contact features must be voluntary, revocable, and member-directed. A trusted contact is informed, never given account access, and designs should allow for the possibility that the person exploiting a member is a relative or caregiver. Do not restrict members solely because of age or another demographic trait.

THE GOAL

Develop a fintech tool that protects members from scams, fraud, and identity theft by helping them identify threats and safeguard their financial accounts and personal information.
